

What WRITA offers

WRITA allows users to unlock the data stored in SAP's R/3 database. This revolutionary desktop/ web-based product provides a wizard to browse and retrieve SAP data and place it in a relational database. From here, Business Intelligence users can manipulate, analyze and format the SAP data as easily as any other data source.

This product effectively gives an end user of BPM or BI the ability to either replicate the data into a SQL or XML format or any other desired format enabling these BPM or BI tools to work natively with the data in their preferred format and preferred database.

Writa SAP tools help users to retrieve data from local or remote SAP server and stage the data locally to a user desired database like SQL Server or Oracle.

In the ideal Business Intelligence deployment, the data that business analysts and managers need is directly and immediately accessible. Users with only the most basic computer skills can retrieve it from a variety of disparate sources, format it into meaningful representations, and use it to drive quick business decisions.

Unfortunately not all data is stored in directly accessible, user-friendly relational tables. SAP R/3 data; for example, resides within a proprietary database structure that is only accessible to highly skilled "ABAP" programmers via handcrafted components called BAPIs (Business Application Programming Interfaces).

Features and Benefit of WRITA

- Provides seamless integration with your existing product and services.
 - Available in two flavors:
 - Standalone desktop edition
 - Web based multi-user edition.
- Solution available as extendable API, which can be used to enhance the features as per user requirement.
- A low cost solution to add value to your business and satisfy the needs of SAP clients.
- The product exists as a well designed package which can be ported to satisfy your technical needs like:
 - COM Objects (Visual Basics)
 - JSP (Java Server Pages)
 - Java Standalone
 - API Ported to .NET
